

Gaussian Process (GP) Regression - Illustration

Bayesian Inference for GPs

Marginal likelihood

- Marginal likelihood

$$p(\text{data}|\text{par}) = \int p(\text{data}|\text{latent})p(\text{latent}|\text{par})d\text{latent}$$

can only be computed if $p(\text{data}|\text{latent})$ is Gaussian

- ... even then

$$\log p(\text{data}|\text{par}) = -\frac{1}{2} \log |K| - \frac{1}{2} \mathbf{y}^T K^{-1} \mathbf{y} + \text{const.}$$

where $K = K(\text{par})$ is generally an $n \times n$ dense matrix!

Stochastic Gradient Langevin Dynamics (SGLD) algorithm

- Stochastic gradient ascent optimization with injected noise η_t

$$\text{par}' = \text{par} + \frac{\alpha_t}{2} \widetilde{\nabla}_{\text{par}} \log p(\text{data}|\text{par})p(\text{par}) + \eta_t \quad \eta_t \sim \mathcal{N}(0, \alpha_t) \quad \alpha_t \rightarrow 0$$

- First phase – α_t large – Optimization phase
 - Injected noise η_t is smaller than the gradient-based update
 - Behavior similar to stochastic gradient ascent
- Second phase – α_t small – Langevin dynamics phase
 - Injected noise η_t dominates gradient-based update
 - Acceptance rate reaches one so no need to accept/reject
 - No need to evaluate $p(\text{data}|\text{par})$
 - We only need stochastic gradients to obtain samples from $p(\text{par}|\text{data})$

Stochastic gradients for GPs

- Marginal likelihood

$$\log p(\text{data}|\text{par}) = -\frac{1}{2} \log |K| - \frac{1}{2} \mathbf{y}^T K^{-1} \mathbf{y} + \text{const.}$$

- Derivatives wrt par

$$\frac{\partial \log p(\text{data}|\text{par})}{\partial \text{par}_i} = -\frac{1}{2} \text{Tr} \left(K^{-1} \frac{\partial K}{\partial \text{par}_i} \right) + \frac{1}{2} \mathbf{y}^T K^{-1} \frac{\partial K}{\partial \text{par}_i} K^{-1} \mathbf{y}$$

- Stochastic estimate of the trace

$$\text{Tr} \left(K^{-1} \frac{\partial K}{\partial \text{par}_i} \right) = \text{Tr} \left(K^{-1} \frac{\partial K}{\partial \text{par}_i} E[\mathbf{r}\mathbf{r}^T] \right) = E \left[\mathbf{r}^T K^{-1} \frac{\partial K}{\partial \text{par}_i} \mathbf{r} \right]$$

with $E[\mathbf{r}\mathbf{r}^T] = I - \text{e.g.}, r_j$ drawn from $\{-1, 1\}$ with $p = 1/2$

- Stochastic gradient

$$-\frac{1}{2N_r} \sum_{i=1}^{N_r} \mathbf{r}^{(i)T} K^{-1} \frac{\partial K}{\partial \text{par}_i} \mathbf{r}^{(i)} + \frac{1}{2} \mathbf{y}^T K^{-1} \frac{\partial K}{\partial \text{par}_i} K^{-1} \mathbf{y}$$

- Linear systems only!

Solving linear systems

- Linear systems:

$$K\mathbf{s} = \mathbf{b}$$

- Can be solved using the Conjugate Gradient algorithm:

$$\mathbf{s} = \arg \min_{\mathbf{x}} \left(\frac{1}{2} \mathbf{x}^T K \mathbf{x} - \mathbf{x}^T \mathbf{b} \right)$$

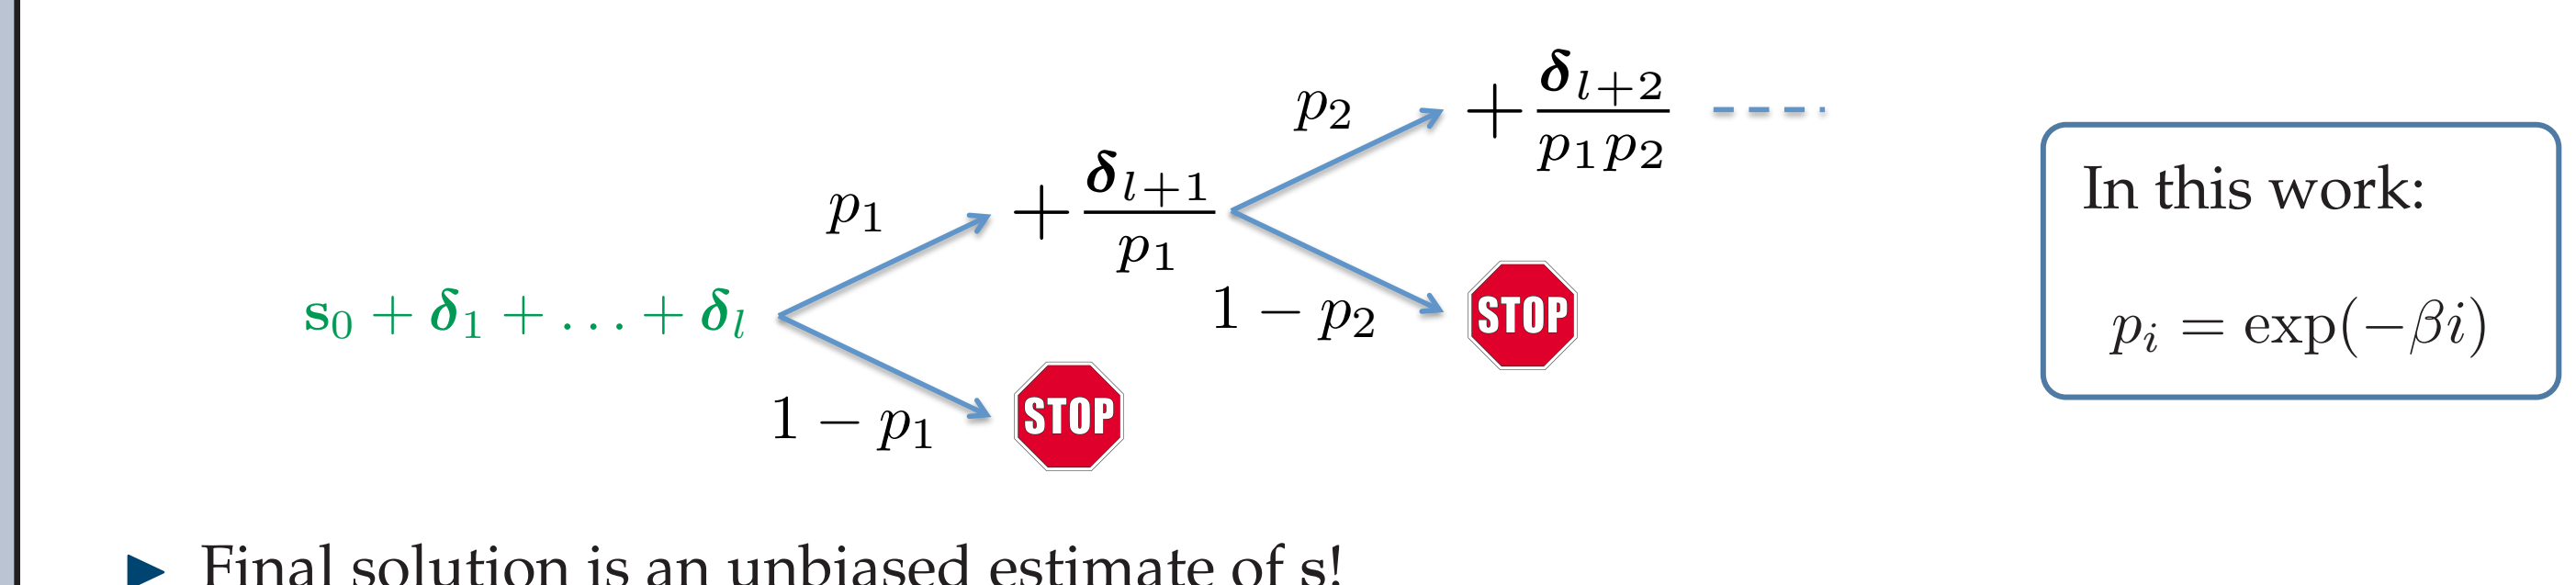

- Iterative update $\mathbf{s} = \mathbf{s}_0 + \delta_1 + \dots + \delta_T$
- Requires only Covariance Matrix Vector Products (CMVPs)! $O(n^2)$ time
- No need to store K ! $O(n)$ space

ULISSE - the Unbiased Linear System SolvEr

- Accelerate the solution of dense linear systems
- ... returning an unbiased estimate of the solution
- Full CG solution:

$$\mathbf{s} = \mathbf{s}_0 + \delta_1 + \dots + \delta_l + \delta_{l+1} \dots + \delta_T$$

- ULISSE:

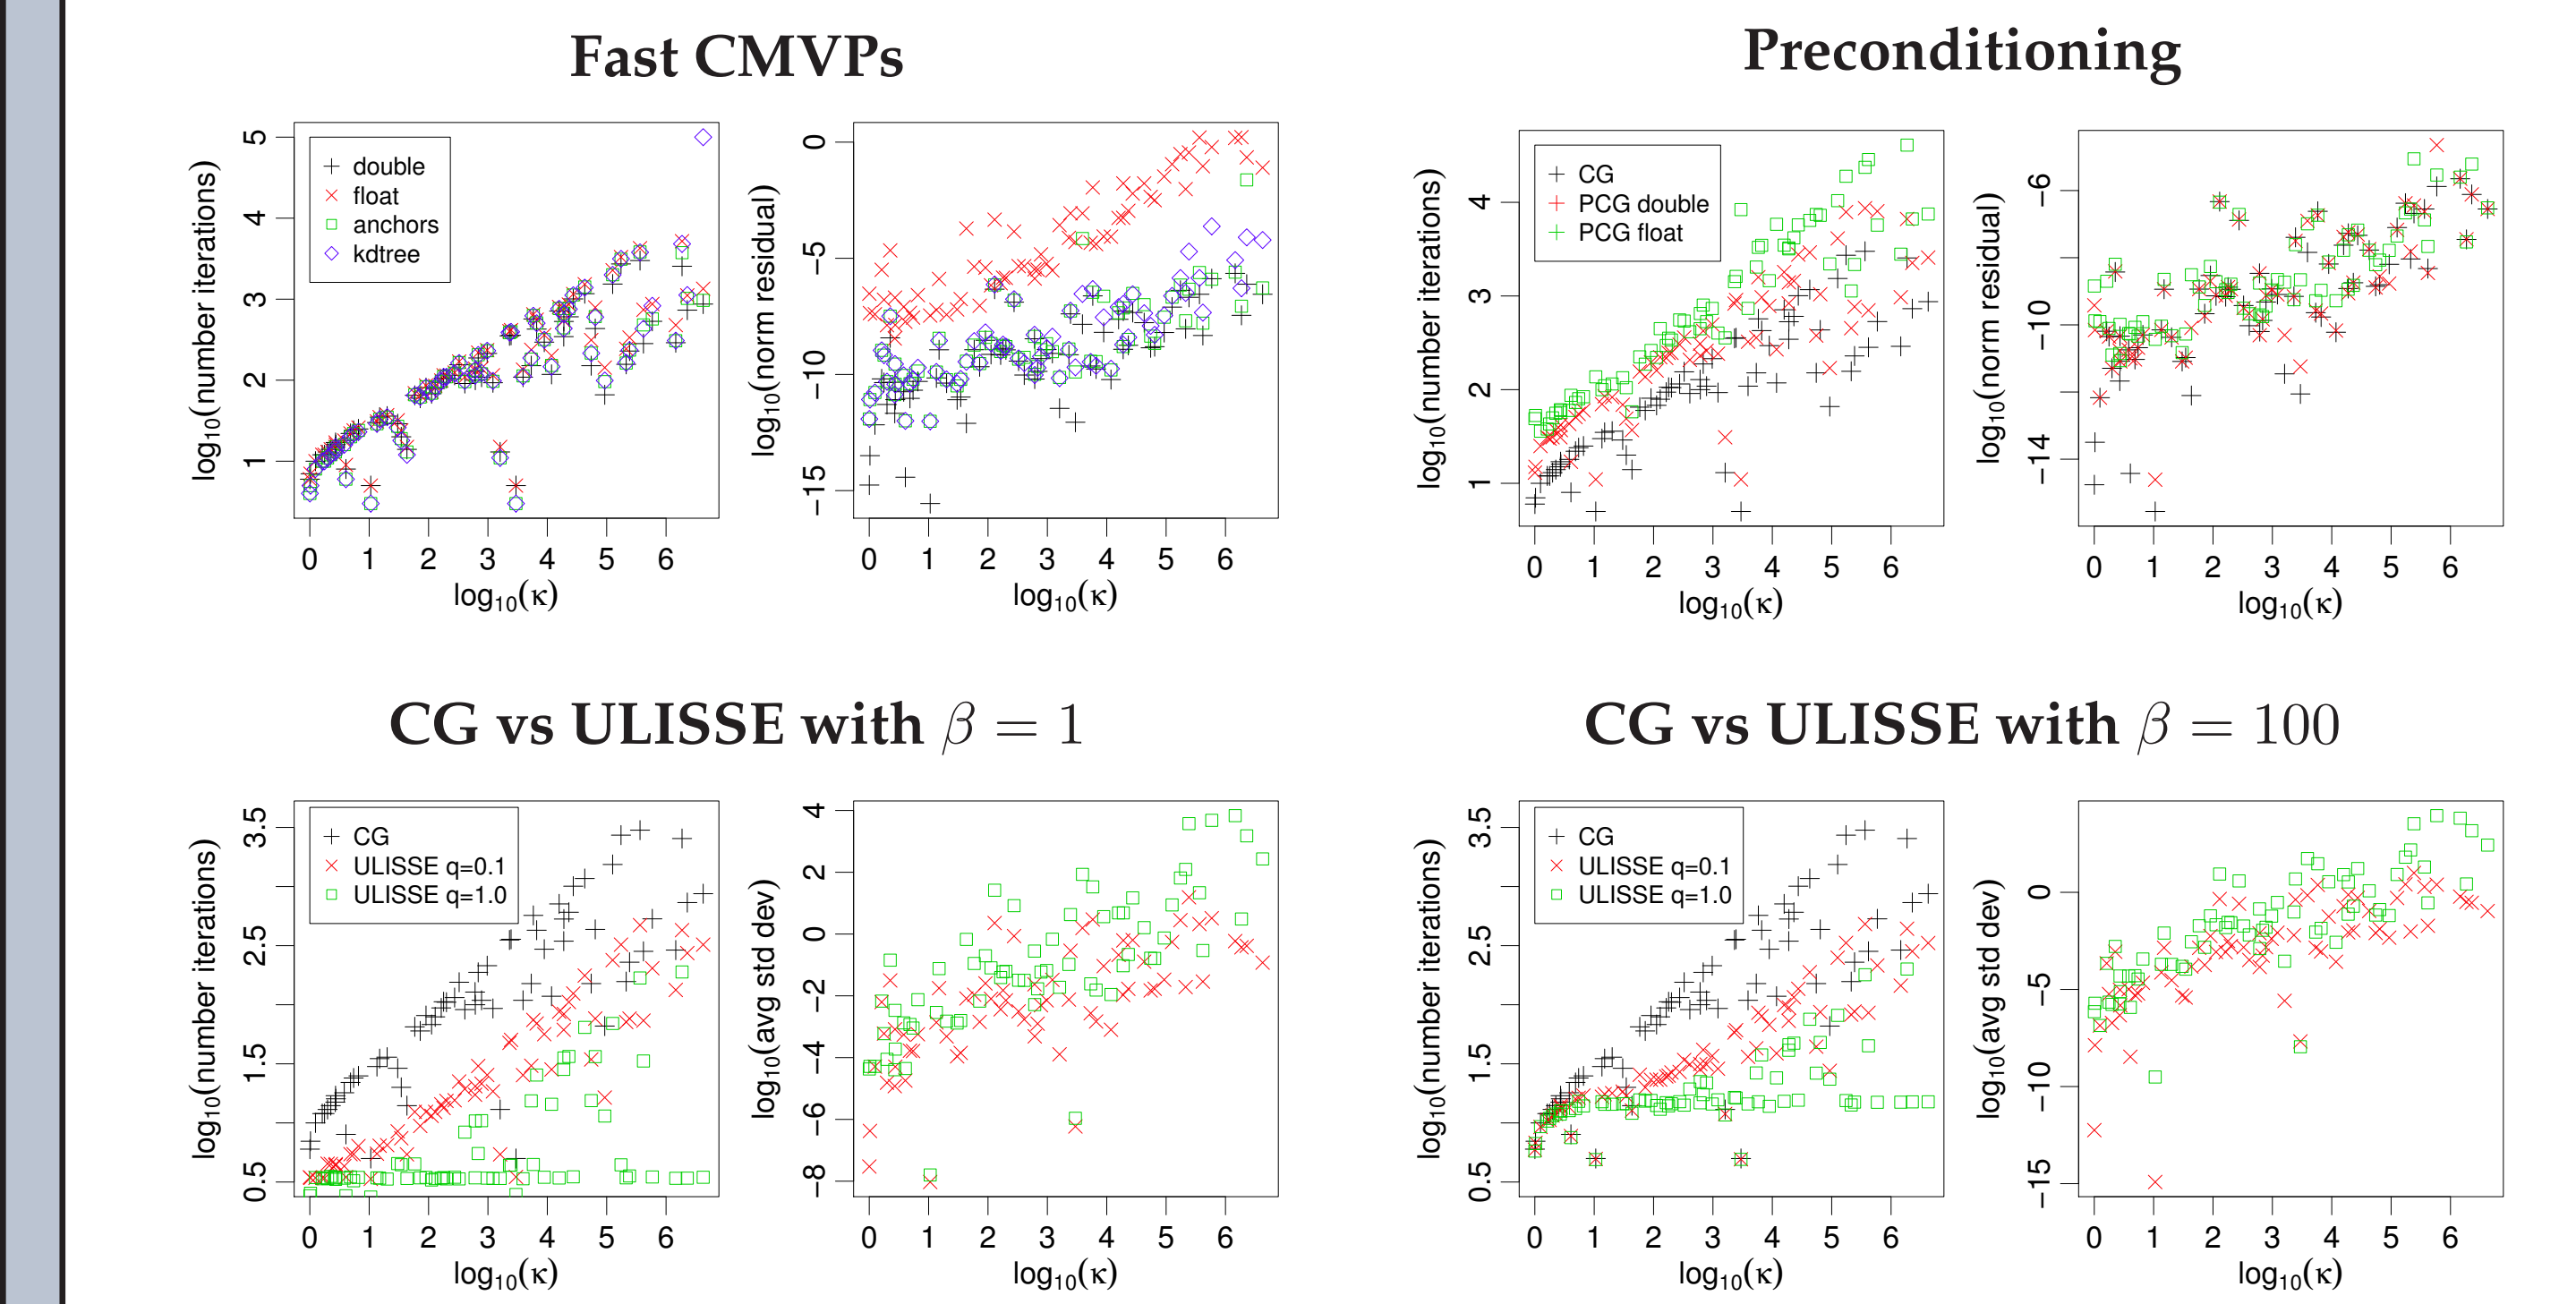

In this work:
 $p_i = \exp(-\beta i)$

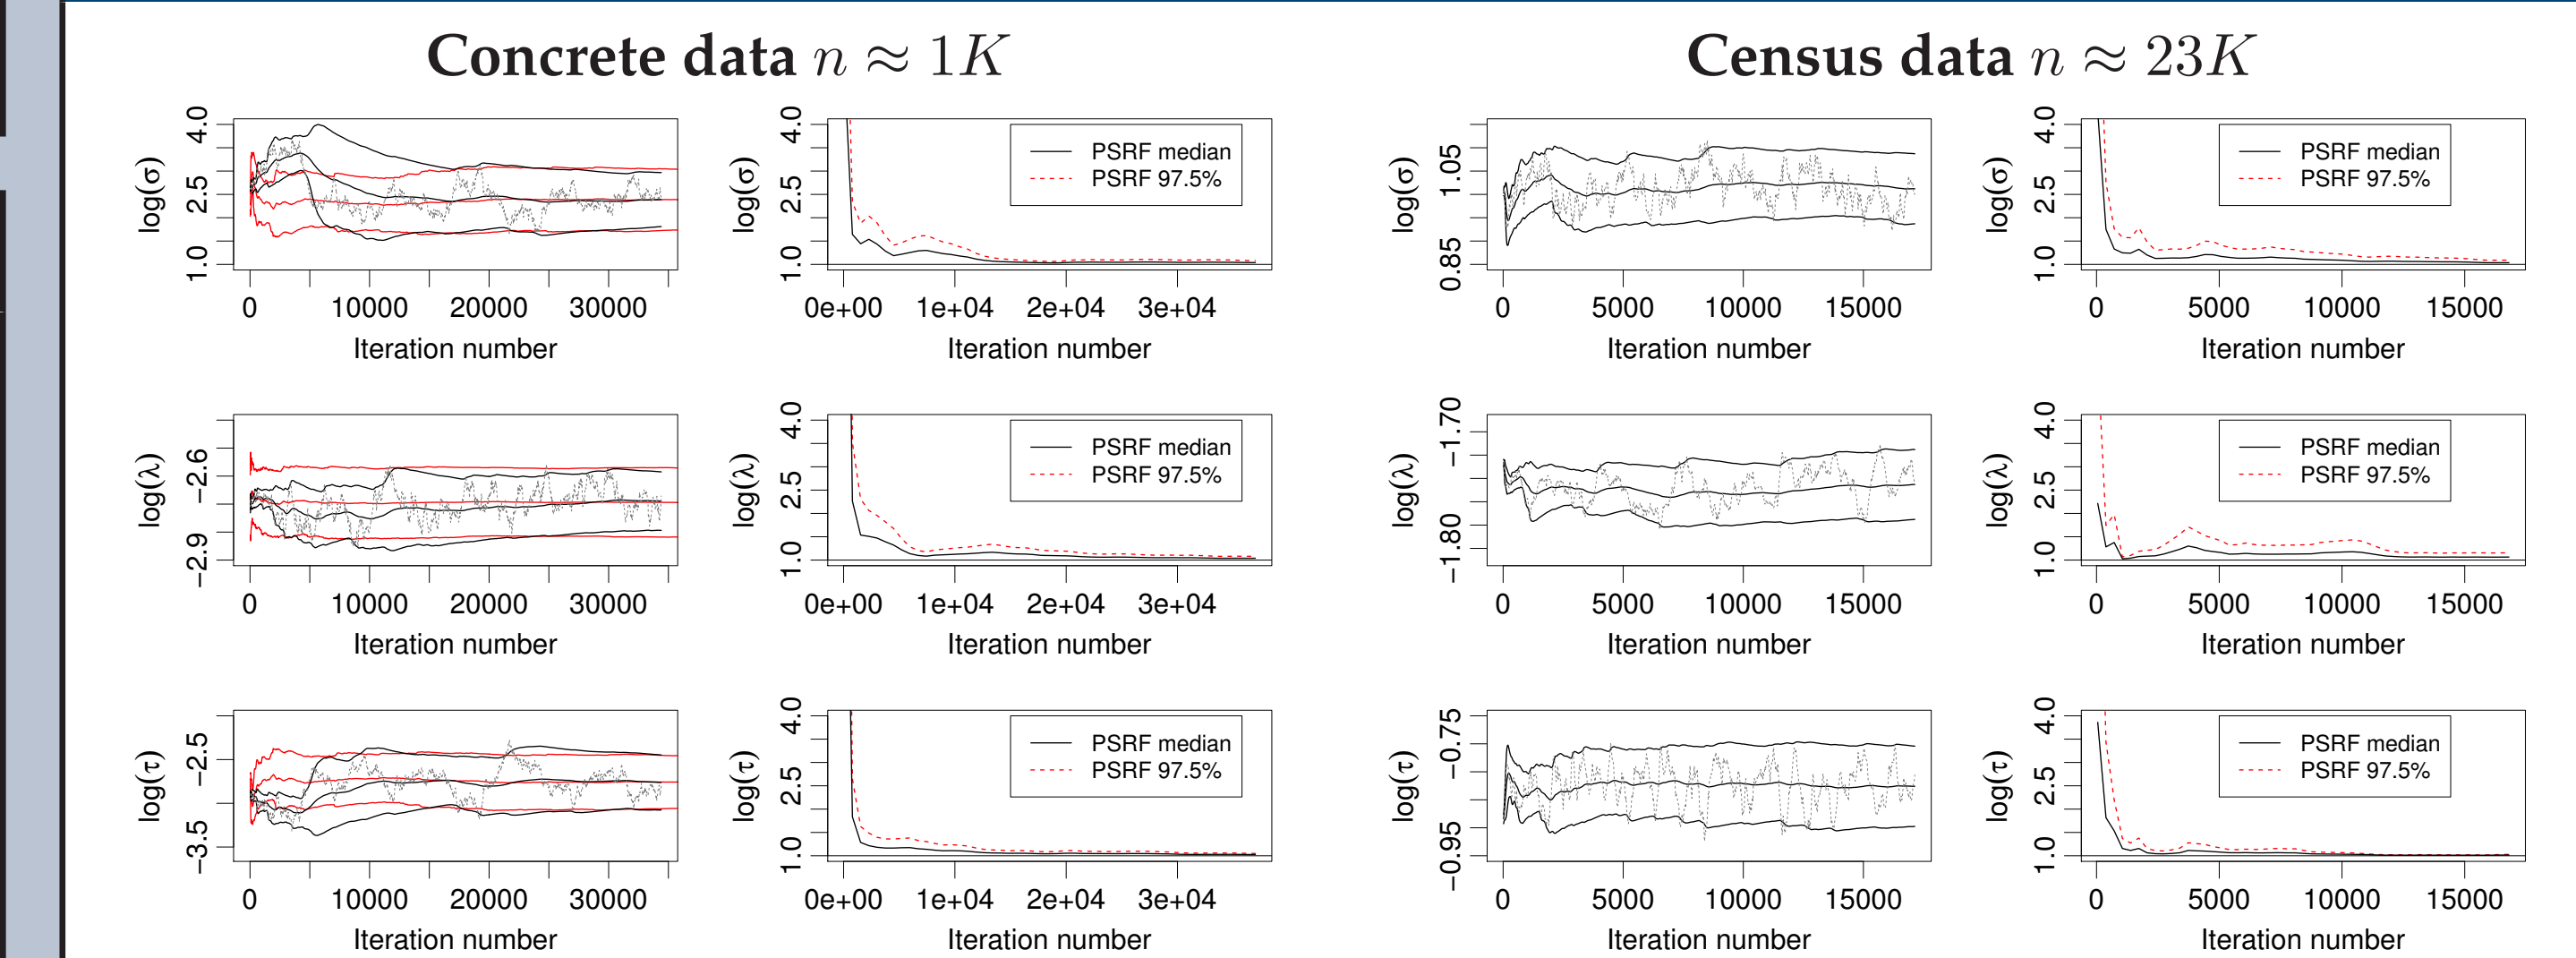

- Final solution is an unbiased estimate of \mathbf{s} !
- Fast computation of stochastic gradients
- Small relative error wrt exact gradients

$$\text{rel square norm} = \frac{\|\mathbf{g}(\theta) - \tilde{\mathbf{g}}(\theta)\|^2}{\|\mathbf{g}(\theta)\|^2}$$

Traditional solvers vs ULISSE

Inference Results

Conclusions

- Novel adaptation of SGLD to infer covariance parameters in Gaussian processes
 - Accurate in characterizing the posterior distribution over covariance parameters
 - Scales with $O(n)$ in space and with $O(n^2)$ in time
 - Massively parallelizable
 - Without assuming factorization of the likelihood (mini-batches)
 - Without considering subsets of the data or inducing points
 - Without considering subsets of the spectrum of the covariance
 - Without imposing sparsity on the covariance or its inverse
- Novel linear solver - ULISSE
 - Early stop of iterative linear solver that yields an unbiased solution
 - Can be adopted to accelerate any iterative solver
- Ongoing work
 - Extension to Gaussian Markov Random Fields and other likelihoods
 - Tuning of a preconditioner in SGLD
 - Mixed precision calculations within the Conjugate Gradient algorithm
